

Task 3: Create a Serverless Function

Objective

Create and deploy a serverless function using Google Cloud Functions and expose it through a public HTTP endpoint.

Steps Performed

1. Step 1: Created a Cloud Function

- Function Name: hello-function
- Runtime: Python 3.14
- Region: asia-south1 (Mumbai)

2. Step 2: Configured HTTP Trigger

- Enabled public access
- Generated a public endpoint URL

3. Step 3: Developed Function Code

The function accepts an optional parameter called "name" and returns a greeting message.

Function Code

```
import functions_framework

@functions_framework.http
def hello_http(request):
    request_json = request.get_json(silent=True)
    request_args = request.args

    if request_json and 'name' in request_json:
        name = request_json['name']
    elif request_args and 'name' in request_args:
        name = request_args['name']
    else:
        name = 'World'

    return f'Hello {name}!'
```

Testing

Endpoint URL:

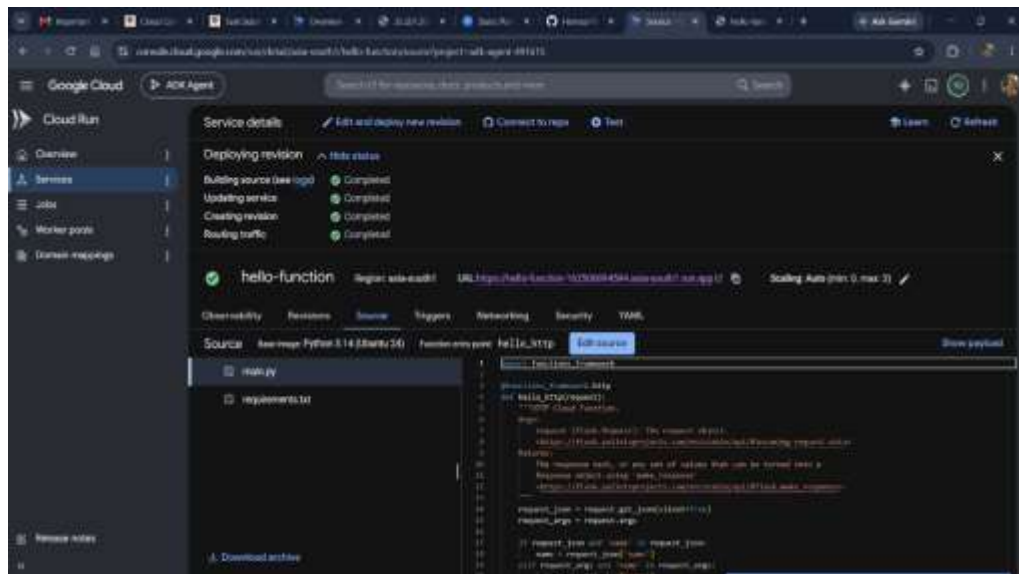

<https://hello-function-162506894594.asia-south1.run.app>

Example Output:

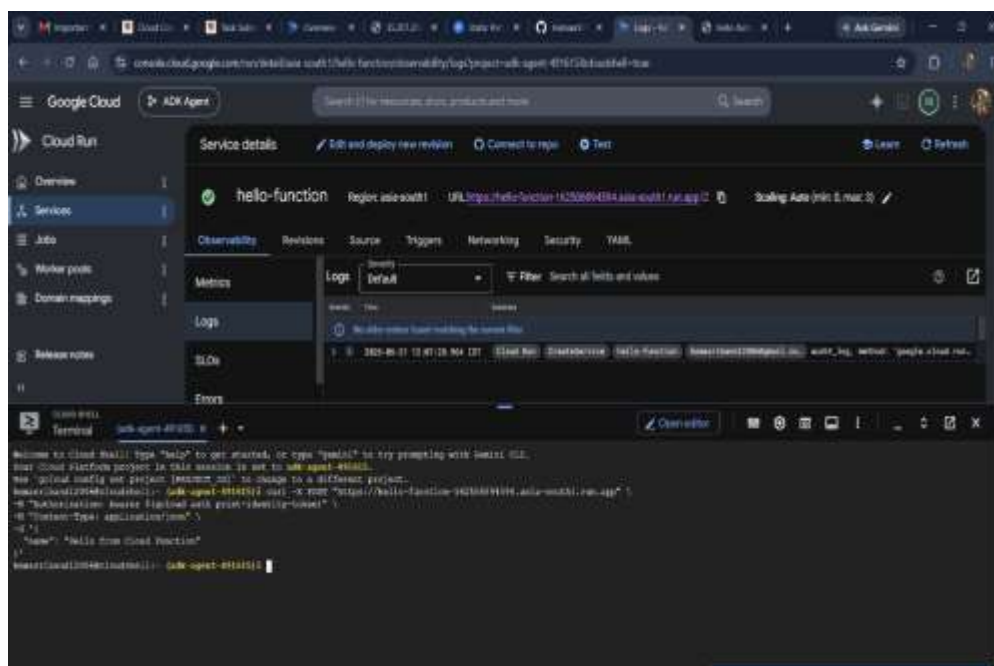

Hello World!

Deliverables

- Public Endpoint URL
- Function Source Code

- Deployment Screenshots

- Function Testing Screenshots

Outcome

Successfully created and deployed a serverless function using Google Cloud Functions and tested it through a public HTTP endpoint.
